CLAIMS

5

10

1. A fluid dynamic bearing apparatus comprising a hydrodynamic groove region in which a plurality of hydrodynamic grooves are arranged, a smooth surface opposing the hydrodynamic groove region, and a bearing gap which is formed between the hydrodynamic groove region and the smooth surface and in which a fluid dynamic pressure is produced by relative rotation of a fixed side and a rotation side,

the smooth surface being defined by a step so that its length becomes shorter than that of the hydrodynamic groove region.

- 2. A fluid dynamic bearing apparatus according to claim 1 which further comprises a bearing sleeve and a shaft member, said bearing gap being formed between the inner circumferential surface of the bearing sleeve and the outer circumferential surface of the shaft member.
- 3. A fluid dynamic bearing apparatus according to claim 2, wherein the shaft member is provided with a flange portion overhanging to the outer diameter side and said bearing gap is further formed between an end face of the flange portion and a face opposing the end face.
- 4. A fluid dynamic bearing apparatus according to claim 1, wherein the hydrodynamic groove region is

plastically processed by thrusting a pattern corresponding to its shape.

5. A motor having a fluid dynamic bearing apparatus according to any one of claims 1 to 4.
